Team Plan Summary

Most of the fundamental concepts of the assignment were discussed together in the same room to ensure that both partners understood the concepts. Benjamin Thorell made a basic framework for the server and client to communicate with each other and interface with javafx. John Lee added the majority of the nicer features (sound, emoji, password retrieval, etc) and reworked the framework where necessary. Benjamin did the majority of the finishing touches and the Server javafx window. All during the process, we met together in the same room intermittently to ensure that we were both on the same page. Debugging was done together so that we could have access to multiple computers. Approximately 5-8 hours were spent working in the same room.
